

Calibrating the Camp Chef Smoke Vault Thermometer

If open the door, then locate the two mounting screws that hold the thermometer assembly in place. Remove both screws while holding the assembly from the front. Don't drop it the glass will break.

Lay the assembly on a flat surface and carefully pry the spring clip up just enough to grab with your fingers. Twist the clip back and forth pull off as you go.

Next gently twist and slide the thermometer out the front of the holder.

Now your thermometer assembly is in three pieces and the thermometer should look like any other calibratable thermometer! See the nut on the stem end?

Bring a cup of water to boil. Grab the nut with a wrench, stick the probe in the boiling water and turn the dial until it reads 212°F or what ever the temperature of boiling water is at your altitude.
